dysfunction, such as cancer, post-herpetic neuralgia, diabetic neurapathy, osteoarthritis, Alzheimer's or Parkinson's diseases, kuru, psychosis and schizophrenia. Probes based on the DNA are used to detect the DNA in usual hybridisation or amplification tests, while monoclonal antibodies are used to detect the protein for diagnosis (in vitro or by in stu immuno-fluorescent assay). Compared with wild-type alpha? nAchR, the protein has about 100-fold greater sensitivity to cholinergic receptor agonists (incotine or acetylcholine) and response to these agonists decays more slowly, but the wild-type inward rectification is
  and immune
  affective disorders
  enzyme dysfunction,

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
